

Mohammed Odejimi

Software Engineer | Backend APIs · Go & Concurrency · ML & RAG Systems
moh.odejimi@gmail.com | github.com/mohodejimi | linkedin.com/in/mohodejimi | Lagos, Nigeria (WAT, UTC+1)

SUMMARY

Software engineering fellow and Physics graduate specializing in backend services in Go, Python, and TypeScript, and in containerized, CI/CD-deployed machine learning APIs. Placed 3rd at the BMONI Hackathon (2026) with a WhatsApp-based conversational fintech backend, and built a spam-detection API that reached 98% accuracy, deployed to the cloud through an automated CI/CD pipeline.

SKILLS

Languages & Frameworks: Python, Go, TypeScript, JavaScript, FastAPI, Node.js, Express

Data & Systems: PostgreSQL, MongoDB, TCP networking, concurrency (goroutines)

Cloud & Infrastructure: Docker, GitHub Actions (CI/CD), GitHub Container Registry, Azure (Linux VMs), Linux

ML & AI: scikit-learn, PyTorch, NumPy, retrieval-augmented generation (RAG)

EXPERIENCE

Talent Nation, Software Engineering Fellow (1-year fellowship) | Lagos, Nigeria Jul 2026 – Present

- Selected for a one-year software engineering fellowship after completing the program's intensive Piscine; building machine learning and backend projects, including the spam-detection API below.
- Reviewed other fellows' work and volunteered in tutorial sessions to help fellows through the curriculum.

Talent Nation, Software Engineer Trainee (Piscine) | Lagos, Nigeria Mar 2026 – Apr 2026

- Completed a month-long intensive program in Go, problem-solving, and version control.
- Built weekly “raid” projects with randomly assigned peers using Git, then presented and defended the technical solutions in project reviews.

PROJECTS

ChatMonie, Conversational Fintech on WhatsApp (3rd Place, BMONI Hackathon) | chatmonie.vercel.app 2026

- Co-built the TypeScript/Node.js backend on a 3-person team for an app that lets users perform financial operations through natural-language chat on WhatsApp.
- Owned user onboarding, KYC and smart-wallet creation on BMONI APIs: BVN verification, user provisioning, wallet creation, document verification, and account activation.

ContextVault, RAG over company documents (in progress)

- Building an AI system that turns company documents into a searchable RAG knowledge base that returns grounded answers with citations.

Spam Detection API, Python, FastAPI, scikit-learn | github.com/MohOdejimi/spam-detection-api

- Built and deployed an end-to-end spam classification service reaching 98% accuracy and ~94.4% precision, recall and F1, with model training and artifact generation separated from production inference.
- Containerized it with Docker and built a GitHub Actions pipeline that lints, runs automated tests, publishes versioned images to GitHub Container Registry, and deploys releases to an Azure Linux VM.

TCPChat, Go | github.com/MohOdejimi/TCPChat

- Built a concurrent TCP chat server with broadcast and private messaging, username registration, and command-based interactions.
- Gave each client dedicated read and write goroutines so messages flow both ways at once without blocking; tested with 10 concurrent client connections.

EDUCATION & RECOGNITION

B.Sc., Physics, University of Ibadan 2026

3rd Place, BMONI Hackathon (2026) · IEEE Xtreme 18.0: 8th in Nigeria (team) · O'Reilly DEI Scholar (1 of 500 worldwide)
